However, the potential drop ($V_1 = Q/C_1$) on one capacitor may be different from the potential drop ($V_2 = Q/C_2$) on another capacitor, because, generally, the capacitors may have different capacitances. The series combination of two or three capacitors resembles a single capacitor with a smaller capacitance. Generally, any number of capacitors connected in series is equivalent ...

With few, the exact value of the capacitor is not very critical. Most caps are used to decouple power rails. Most caps in use are +/- 20%. Areas where the exact value matters are analog circuits such as filters, or oscillators, voltage multipliers and other frequency sensitive circuits.
