For example, I need 100uF 60V capacitor for filtering in power supply. The DC source is about 40V, but I have 400uF 20V capacitors. If I arrange four of them in series I got in total 100 uF and each The DC source is about 40V, but I have 400uF 20V capacitors.

I later discovered that he had used 60v polystyrene capacitors instead of the 500v silver micas I had specified. He had also soldered (and not that well either) the polystyrene caps to the printed circuit board and obviously the excessive heat from the iron permanently changed the capacitance of them. Result was the artificial lines didn't exhibit the correct loss vs ...
