Ability to undergo ideal charging and discharging cycles with minimum hysteresis and fast response (e.g., suitable reaction kinetics for thermochemical materials, small melting range of PCMs) and without losses in performance in terms of storage capacity over many cycles (high cycling stability, high thermal stability, long service life, no sintering, and the following ...

High temperature increases the risk of failure and safety accidents of the charging pile. For example, the battery is easy to expand at high temperatures and may explode in severe cases. In addition, a high-temperature environment will also increase the risk of fire and pose a threat to personal and property safety.

Currently, some experts and scholars have begun to study the siting issues of photovoltaic charging stations (PVCSs) or PV-ES-I CSs in built environments, as shown in Table 1.For instance, Ahmed et al.
