Can superconducting magnetic energy storage (SMES) units improve power quality?

Furthermore, the study in [1] presented an improved block-sparse adaptive Bayesian algorithm for completely controlling proportional-integral (PI) regulators in superconducting magnetic energy storage (SMES) devices. The results indicate that regulated SMES units can increase the power quality of wind farms.

What is a superconducting system (SMES)?

A SMES operating as a FACTS was the first superconducting application operating in a grid. In the US, the Bonneville Power Authority used a 30 MJ SMES in the 1980s to damp the low-frequency power oscillations. This SMES operated in real grid conditions during about one year, with over 1200 hours of energy transfers.

Can a superconducting magnetic energy storage unit control inter-area oscillations?

An adaptive power oscillation damping (APOD) technique for a superconducting magnetic energy storage unit to control inter-area oscillations in a power system has been presented in [2]. The APOD technique was based on the approaches of generalized predictive control and model identification.

How to design a superconducting system?

The first step is to design a system so that the volume density of stored energy is maximum. A configuration for which the magnetic field inside the system is at all points as close as possible to its maximum value is then required. This value will be determined by the currents circulating in the superconducting materials.

What are the emerging energy storage technologies?

These energy storage technologies are at varying degrees of development, maturity and commercial deployment. One of the emerging energy storage technologies is the SMES. SMES operation is based on the concept of superconductivity of certain materials.

What are the applications of superconducting power?

Some application scenarios such as superconducting electric power cables and superconducting maglev trains for big cities, superconducting power station connected to renewable energy network, and liquid hydrogen or LNG cooled electric power generation/transmission/storage system at ports or power plants may achieve commercialization in the future.
