What are battery storage systems?

Battery storage systems will play an increasingly pivotal role between green energy supplies and responding to electricity demands. Battery storage, or battery energy storage systems (BESS), are devices that enable energy from renewables, like solar and wind, to be stored and then released when the power is needed most.

Are lithium-ion batteries a viable energy storage solution?

Lithium-ion batteries were developed by a British scientist in the 1970s and were first used commercially by Sony in 1991, for the company's handheld video recorder. While they're currently the most economically viable energy storage solution, there are a number of other technologies for battery storage currently being developed.

What is battery energy storage technology?

Battery energy storage technology is based on a simple but effective principle: during charging, electrical energy is converted into chemical energy and stored in batteries for later use. The system works according to a three-stage process: An effective battery energy storage system consists of several coordinated components:

Why do we need battery energy storage systems?

With the increasing importance of renewable energies, the need for efficient energy storage solutions is also growing. Battery energy storage systems (BESS) play a key role here - they make it possible to store energy and retrieve it when needed, reducing dependence on the power grid.

How does intelligent battery software work?

Intelligent battery software uses algorithms to coordinate energy production and computerised control systems are used to decide when to store energy or to release it to the grid. Energy is released from the battery storage system during times of peak demand, keeping costs down and electricity flowing.

What is a lithium ion battery?

The Li-ion battery is classified as a lithium battery variant that employs an electrode material consisting of an intercalated lithium compound. The authors Bruce et al. (2014) investigated the energy storage capabilities of Li-ion batteries using both aqueous and non-aqueous electrolytes, as well as lithium-Sulfur (Li S) batteries.
